Title : Reamination of purine compounds with glyoxylic and glycolic acids

Periodical : Dok. AN SSSR 101/1, 135-136, Mar 1, 1955

Abstract : The biosynthesis of glycocoll obtained from glyoxylic and glycolic acids and aminopurine derivatives was investigated to determine whether and what role purine compounds play in the reamination reaction in the animal organism. The experiments were carried out on white rats and the results obtained are tabulated. Seven references: 2 USSR and 5 USA (1945-1954). Table.

TITLE: Investigation of the quarternary system In-Sb-Cd-Sn in order to determine the phase equilibria at the InSb-CdSnSb<sub>2</sub> cross section

SOURCE: AN SSSR. Izvestiya. Neorganicheskiye materialy, v. 2, no. 8, 1966, 1416-1428

TOPIC TAGS: phase diagram, phase structure, phase equilibrium, phase analysis, indium, antimony, cadmium

ABSTRACT: The object of the study was to determine the phase equilibria at the cross section of the In-Sb-Cd-Sn system which involves InSb and an alloy composed of 50 mol % CdSb and 50 mol % SnSb. The composition of this alloy corresponds to CdSnSb<sub>2</sub>, a non-existent compound. The samples for the study were prepared by fusing mixtures of pure components in evacuated quartz ampoules at 700-800°C. Depending on specific composition, the alloy samples were homogenized by holding for at least 2000 hrs at 450, 400, 320, or 300°C. The phase diagrams are presented for all binary and ternary systems included in the In-Sb-Cd-Sn system. The results of the microstructure analysis and microhardness for all systems investigated are tabulated. The InSb-(CdSnSb<sub>2</sub>) and the CdSb-SnSb cross sections were found to be non-quasibinary. The CdSb-SnSb alloy was found

TITLE: Analysis of 9-Bev proton-nucleon interaction in a nuclear  
emulsion

PERIODICAL: Zhurnal eksperimental'noy i teoreticheskoy fiziki, v. 42  
no. 1, 1962, 3 - 11

TEXT: A constant distribution of transverse momenta is assumed for the  
suggested method of studying the dependence of angular and energy character-  
istics of proton-nucleon interaction on multiplicity. All showers observed  
in a p (R) type НИКФИ (NIKFI) emulsion irradiated with 9-Bev protons from  
the proton synchrotron of the OIYAI were classified according to their  
multiplicity. The transverse momenta of the secondary particles are con-  
stant over a wide range of primary particle energies and depend only  
slightly on multiplicity and target mass. The experimental distribution of  
 $p_{\perp}$  is satisfactorily approximated by  $\Delta N/N \Delta p_{\perp} = c p_{\perp} \exp(-p_{\perp}^2/b^2)$  (1). Own ✓

Analysis of 9-Bev proton-nucleon...

to the law of conservation of momentum, the mean value of  $p_1$  increases with increasing  $\theta$  in the case of small angles. Results of this method show better agreement with the experiment than earlier methods. The angular distribution of shower particles becomes more isotropic (in the c.m.s.) with increasing multiplicity. The particle emission of the 3 and 8-pronged stars forward and backward is not symmetric. The best agreement with the expected Lorentz factor ( $\gamma_c = 2.4$ ) is attained for mean multiplicities ( $3 < n_s < 8$ ).

The Lorentz factor tends to a decrease with increasing multiplicity. The portion of energy imparted to charged mesons increases with multiplicity in both the laboratory and center-of-mass systems. Hence,  $n(\pi^0)/n(\pi^\pm) < 0.5$  for 7 or 8-pronged stars with equal energy spectra of  $\pi^0$  and  $\pi^\pm$  mesons. The estimable mass of the target particles increases with multiplicity, but does not exceed the nucleon mass estimated by N. G. Birger and Yu. A. Smorodin (ZhETF, 36, 1159, 1959). This justifies the criteria of selecting nucleon-nucleon interactions. The coworkers of the OIVAI are thanked for discussions, I. M. Gramenitskiy and M. I. Podgoretskiy for supplying their preprint on the angular distribution of particles in 8-pronged stars. There are 7 figures, 1 table, and 15 references: 11 Soviet and 4 non-Soviet.

PHASE I BOOK EXPLOITATION

SOV/1393

Akademiya nauk SSSR. Institut nafti

Trudy, t. 11. Neftepromyslovoye delo (Transactions of the Petroleum Institute, Academy of Sciences, v. 11. Oil Field Industry) Moscow, Izd-vo AN SSSR, 1958. 346 p. 2,000 copies printed.

Resp. Ed.: Krylov, A.P., Ed. of Publishing House: Sevina, Z.A.; Tech. Ed.: Kiseleva, A.A.

PURPOSE: This book is intended for geological engineers specializing in oil well drilling and oilfield operations.

COVERAGE: This book, a collection of 26 articles, describes the mineral composition of hard, friable, and plastic rocks, their deformation and destruction at various geological platforms of the Soviet Union; it further presents designs of rock bits with different cutters, which can be successfully used for crushing various formations. The effect of electric current on binding

Card 1/10

Transactions of the Petroleum Institute

SOV/1393

substances such as cement slurry, plaster and lime solutions, as well as their treatment with electric current carried out to accelerate hardening are also discussed. It is stated that electric current may be used for strengthening the walls of a well, and that this promising method has been successfully tested on various cores. Designs of electrodes used for this purpose are presented. Drilling of deep wells with conventional and sectional turbodrills is analyzed, and turbodrill parts described. Oil well drilling in eastern Soviet regions appears to be complicated by an excessive filtration of drilling fluid into formations of various horizons. To overcome this, methods improving the plugging properties of cement slurry are proposed. In this connection the adhesion of stone-like cement to rocks of different composition has been studied with the aid of various apparatus, and the filtration of drilling fluid into formations of Tatar Republic oilfields has been analyzed. Methods of eliminating the negative centrifugal force of presently used deep well pumps are proposed, as are new systems of pump jacks. The restoration of bottom-hole pressure in formations with

Card 2/10

Transactions of the Petroleum Institute

SOV/1393

varying permeability is investigated on the basis of theoretical calculations and graphs. Attempts to extract petroleum from the loose sands of the Romashkino oilfield by injecting water or certain petroleum products, free of paraffin and tar, are described and results of experiments given. The method of stimulating petroleum flow in various petroliferous provinces by injecting high pressure gas into a partially depleted formation is explained, and some recommendations given. The process of subterranean burning of a part of the petroleum deposit, as a thermal method of petroleum recovery, is discussed, and laboratory experiments illustrated by numerous graphs. Tectonics of soft, clayey rocks are investigated in connection with the problem of caving, and the results of experiments made to ascertain the effect of tension and moisture on the stability of such rocks are analyzed. The influence of pressure on the selective saturation of quartz rocks with water or petroleum, as well as on the saturation of porous rocks is investigated. Laboratory experiments were made in an attempt to find out the saturation rate of various minerals wetted with water after being treated

Card 3/10

Transactions of the Petroleum Institute

SOV/1393

with various solutions. Tests conducted in connection with the problem of equipment corrosion proved that DC-Na solution is a good inhibitor against corrosion and that sulfide coating is a good protective agent for steel against corrosion. The procedure of turbine drilling under different conditions is analyzed and the advisability of lowering the upstream pressure of the drilling fluid is emphasized. The prevention of caving by applying various methods is discussed, and the application of a coefficient established on the basis of calculations is recommended. Hydraulic fracturing of formations and the treatment of oil wells with hydrochloric acid are also recommended as efficient methods for boosting crude oil production. The development of natural gas recovery in the Saratov and Stalingrad regions is outlined, and the advantage of the utilization of natural gas on a larger scale is emphasized. Bibliographic references accompany each article.

Destruction of rocks during dynamic loading (Razrusheniye gornykh porod pri dinamicheskem nagruzhenii) Moscow, Izd-vo "Nedra," 1964. 158 p. illus., biblio. 1550 copies printed.

TOPIC TAGS: geology, geologic exploration, mining engineering

PURPOSE AND COVERAGE: This book is intended for engineering-technical and scientific staff members of the oil and mining industry. The authors describe the results of the investigation of mechanical properties of rocks at various rates of deformation. They have established new patterns of behavior of rocks under dynamic load—changes in strength and plastic properties of rocks with increases in the rate of deformation. Particular attention was paid to the analysis of the processes of rock breakage in drilling. It is shown that changes in the strength and plastic properties of rocks with increasing rate of dynamic load affect the process of destruction of rocks in drilling.

TITLE: Conditions of extraction of butylrhodamine C fluoroniobate

SOURCE: Zhurnal analiticheskoy khimii, v. 20, no. 9, 1016-1018

TOPIC TAGS: qualitative analysis, photometry, tantalum, columbium

ABSTRACT: Simultaneous extraction of butylrhodamine C fluoroniobate was observed during the development of the extraction-photometric determination of tantalum, using butylrhodamine C as a solvent (N. I. Pavlova and I. A. Blyum. Zavodskaya laboratoriya, 28, 1305, 1962). This property of the dye was used in the development of the extraction-photometric determination of niobium. The

Card 1/3

UDC: 543.70

L 16026-66

optimal conditions of extraction were determined and the calibration curve was plotted for niobium determination under these conditions: H<sub>2</sub>O 12 ml., benzene 20 ml., concentration of H<sub>2</sub>SO<sub>4</sub> 10 N, that of fluoride 0.014 g./ml., and that of butylrhodamine C 0.04%. Fifteen ml. of extract were mixed with 10ml. of acetone to stabilize the color of the benzene extraction. The optical density was measured in the photocolorimeter FEK-N-57 with the light filter No 6 ( 584 m) at a layer thickness of 5 cm. A comparison of the curves on dependence of the optical densities of extracts on the concentration of the dye in aqueous solution and on that of the fluorine ion in the solution, plotted during these experiments, with those obtained during tantalum determination, showed that the tantalum could be extracted satisfactorily at a considerably lower concentration of the dye. This difference could be used for the determination of niobium in the presence of tantalum, or for a simultaneous determination of tantalum and niobium from the same solution. For this purpose (1) the tantalum was extracted from one aliquot part of the same solution under conditions used for tantalum determination, i.e. at a lower concentration of dye, and (2) both elements were extracted from the other aliquot part under conditions for the extraction of niobium described above. The content of tantalum and niobium was then

TITLE: Analysis of some inelastic p-n-interactions at 9 Bev  
SOURCE: Akad iya nauk Kazakhskoy SSR. Institut yadernoy  
fiziki Trudy. v. 5, Alma-Ata, 1962. Fizika chastits  
vysokikh energiy. Struktura yadra, 3-15

TEXT: The authors studied in detail the characteristics of  
the secondary particles from three-ray p-n-interactions produced by  
9 Bev protons; the work was carried out because of appreciable diff-  
ferences in the results for such reactions given in the literature.  
Nuclear emulsions type НИКФИР (NIKFI-R) were used. The aggregate  
angular distribution of  $\pi^-$ -mesons and protons is symmetrical in the  
center-of-mass system (CMS); the individual angular distribution for  
 $\pi^-$ -mesons and protons are asymmetric in CMS, protons predominating  
in the back direction and  $\pi^-$ -mesons in the forward direction. The  
energy spectrum of protons in CMS is harder than that predicted by

TITLE: Analysis of p-nucleon interactions produced at an energy of  $10^{10}$  eV in nuclear photoemulsion

SOURCE: Akademiya nauk Kazakhskoy SSR. Institut yadernoy fiziki. Trudy. v. 5. Alma-Ata, 1962. Fizika chastits i vysokikh energiy. Struktura yadra, 16-32

TEXT: The authors have developed a new method of finding the angular and energy characteristics of nuclear disintegrations that is based on the calculation of the distribution of transverse momentum of secondary particles; for all identifiable particles the method gives closer agreement with experiment than other methods of approximation. The method permits an estimate of the dependence of the following characteristics on observed multiplicity: a) the degree of anisotropy of the angular distribution of shower particles in the center-of-mass system (CMS) for a Lorentz-factor ( $\gamma_c$ ) of 2.4 decreases with increasing multiplicity; for 3- and 8-ray stars

Card 1/3

S/707/62/005/000/002/014  
D290/D308

Analysis of p-nucleon interactions ...

there is an appreciable asymmetry in forward and backward emission of particles, b) in the region of average multiplicity (between 3 and 8) the best agreement with the expected value  $\gamma_c = 2.4$  is shown by a quantity found by a kinematic method which assumes a uniform distribution of the transverse momenta of shower particles; the assumption  $\beta_c / \beta_i^! = 1$  ( $\beta_c$  is the velocity of the center-of-mass with respect to laboratory coordinates (LC),  $\beta_i^!$  is the velocity of the particles in CMS) leads to a systematic overestimate of the energy by a factor of two. Regardless of the method of estimation,  $\gamma_c$  for 3-ray stars is too high, while  $\gamma_c$  for 8-ray stars is too low; therefore the Lorentz-factor of the system where angular symmetry of the secondary particles is assumed, will decrease as the multiplicity increases, c) as the multiplicity increases, the fraction of the energy carried off by charged meson increases both in LC and CMS, but the fraction of the energy per meson is almost unchanged (about 17%); therefore  $n_{\pi^0}/n_{\pi^\pm} < 0.5$  for 7- and 8-ray stars provided that the energy spectra  $n_{\pi^0}/n_{\pi^\pm}$  of  $\pi^0$  and  $\pi^\pm$ -mesons are identical. The mass of the target also increases with the multi-

S/0120/64/000/001/0076/0081

AUTHOR: Boos, E. G.; Pavlova, N. P.; Volkova, O. I.; Gunenkova, O. V.; Zaytsev, K. G.; Kholmetskaya, A. V.

TITLE: Methods of measuring ionization losses of relativistic particles in a nuclear emulsion

SOURCE: Pribory\* i tekhnika eksperimenta, no. 1, 1964, 76-81

TOPIC TAGS: ionization loss, relativistic particle, relativistic particle ionization loss, nuclear emulsion, Ilford G-5 emulsion, emulsion development, emulsion development irregularity

ABSTRACT: Irregularities of development of Ilford G-5 nuclear emulsion were studied; methods of eliminating them are suggested. A stack of 40 G-5 films, 600-micron thick, 12×20 cm was irradiated (in CERN) by a 91.8-Gev/s-mean-impulse proton beam. To find the irregularity of development of the emulsion films, the density of blobs on the relativistic-particle tracks was investigated both in the plane parallel to the emulsion and in depth. The effects of the micro-

Card 1/2

ACCESSION NR: AP4018368

scope field-of-view illumination, experimenters' characteristics, and the track immersion angle upon the accuracy of measurements were studied. It was proven that a desirable accuracy (2% or better) in determining ionization losses with immersion angles up to 10° is attainable. The technique of "joining" tracks in adjacent emulsion layers is discussed. "The authors wish to thank Zh. S. Takibayev and I. Ya. Chasnikov for a useful discussion of this project, and the workers of the High-Energy-Particle Laboratory, A. A. Alpy\*sbayeva, Ts. Ya. Kagasova, D. I. Yermilova, F. N. Trushlyakov, T. T. Terniraliyev and G. A. Grigor'yeva, for their help in carrying out this project." Orig. art. has: 3 figures and 3 tables.

TOPIC TAGS: proton nucleon interaction, proton scattering, emulsion, proton proton interaction, proton neutron interaction

ABSTRACT: The investigation was made with a stack of 600  $\mu$  Ilford G-5 emulsions measuring 12 x 20 cm, irradiated in the CERN proton synchrotron. Scanning was along the tracks of the primary particles in an MBI-9 microscope with a magnification of 900x. The criteria used to select interactions in free and quasi-free nucleons

Card 1/3

L 22173-65

ACCESSION NR: AP5001823

are described. Altogether 7,960 events were detected in a total primary track length of 2,927 meters (corresponding to a mean free path  $36.8 \pm 0.4$  cm). From these, 1,035 elastic p-N interactions were selected. The distribution of the p-p events with respect to the number of prongs is in agreement with hydrogen bubble chamber data. The mean number of charged secondary particles from p-p and p-n interactions are  $4.3 \pm 0.2$  and  $4.5 \pm 0.2$ , respectively. Showers with asymmetric emission of charged particles in the c.m.s. were also investigated. The distribution of the asymmetry of the individual interactions can be explained by assuming that the shower particles are deflected from symmetric emission in random fashion. The dependence of the multiplicity on the type of target nucleus is analyzed, and the experimental data are compared with the predictions of various theoretical mechanisms for the interaction between the nucleons and nuclei. It is shown that the best agreement is obtained with the cascade model calculations performed at OIYaI. "The authors thank the members of the High Energy Labora-

TITLE: Determination of the nature of secondary particles by the photo-emulsion method in the area of high energies

SOURCE: Pribory i tekhnika eksperimenta, no. 2, 1965, 63-64

TOPIC TAGS: pi meson, proton, K meson, meson, high energy particle

ABSTRACT: In order to determine the nature of secondary particles in the area of high energies, the author analyzed secondary particles from three-ray p-n interactions formed by protons with an impulse of 19.8 gev. The traces of the incident protons provided independent confirmation of the correctness of the method used for identification of the secondary particles. The relations between the number of p-n mesons, pi mesons, K-mesons, and protons in various areas of  $p/c$  were found:  $2.5 < p/c < 5$  gev -  $N_{\pi} : (N_K + N_p) = 90:10$ ;  $5 \text{ gev} < p/c < 20 \text{ gev} -- N_{\pi} : N_K : N_p = 47:10:43$ .

It is shown that the pi-mesons can be separated from the heavier particles in the area of  $p/c$  between 2.5 and 5 gev and that in the area between 5 and 20 gev the portion of K-mesons can also be evaluated. The number of particles of various types is evaluated as follows for three-ray p-n interactions on the basis of preliminary data:

Cord 1/2

UDC: 539.1.073.7

L 22105-66

ACC NR: AP6012937

2.5 gev < p < 5 gev  $N_{\pi} : (N_K + N_p) = 90:10$

5 gev < p < 20 gev  $N_{\pi} : N_K : N_p = 47:10:43$

2.5 gev < p < 20 gev  $N_{\pi} : N_K : N_p = 62:6:32$

These relations indicate the considerable reduction of pi-mesons with increasing energy and the corresponding increase in K-mesons and protons. The authors thank the workers of the Department of High energy, IIaF, AN KazSSR, for participating in processing and discussing the experiments. Further thanks is made to the Emulsion Committee, TsYeRN for making the emulsion stacks available. Orig. art. has: 2 figures. [JPRS]
